This book will help you take a badly wounded patient to the operating room, organize yourself and your team, do battle with some vicious injuries and come out with the best possible result. It is a practical guide to operative trauma surgery for residents and registrars, for general surgeons with an interest in trauma, and for isolated surgeons operating on wounded patients in military, rural or humanitarian settings. A surgical atlas may show you what to do with your hands but not how to think, plan and improvise. Here you will find practical advice on how to use your head as well as your hands when operating on a massively

bleeding trauma patient. The first part of this book presents some general principles of trauma surgery. The second part is about trauma surgery as a contact sport. Here we show you how to deal with specific injuries to the abdomen, chest, neck and peripheral vessels. The single most important lesson we hope you will derive from this book is to always keep it simple because, in trauma surgery, the simple stuff works.

Transplantation of the Pancreas - Rainer W.G. Gruessner 2004-04-27
Although pancreas transplants have been performed for more than 30

years, the last few years have witnessed significant growth in the options available for pancreas transplantation as well as substantial improvements in outcome. It is therefore appropriate that a new text summarize the recent advances and put forth the standard of future care. Transplantation of the Pancreas, edited by Drs. Gruessner and Sutherland fulfills this mission by providing a state-of-the-art, definitive reference work on pancreas transplantation for transplant surgeons and physicians as well as for endocrinologists, diabetologists, nephrologists, and neurologist. The editors, from the renowned University of Minnesota Transplant Division and the Diabetes Institute, have assembled a group of renowned experts to provide an all inclusive overview of pancreas transplantation. The text features insights on the pathophysiology of diabetes mellitus and the limitations of nontransplant treatments, highlights experimental research and clinical history of pancreas transplantation, and compares and contrasts different surgical procedures. The discussions detail the broad spectrum of posttransplant complications and their treatments, which frequently require skills in general, vascular, and laparoscopic surgery, interventional radiology, critical care, and infectious disease. Chapters on immunosuppression, immunology, pathology, long-term outcome, quality of life, and cost-effectiveness focus on issues unique to pancreas recipients. Evolving areas, such as pretransplant evaluation of pancreas transplant candidates, living donation, and the current status of islet transplantation are discussed. Augmented by more than 280 illustrations, including full color line drawings created exclusively for the text, this book is the standard reference for all transplant professionals as well as all physicians caring for diabetic patients.
